

Fahad Hussain

Senior Flutter Developer | Former CTO, AppSpot Software Solutions

Peshawar, Pakistan | +92 308 8432235 | hussainfahad660@gmail.com | linkedin.com/in/thefaadi619 | github.com/faadi619

PROFESSIONAL SUMMARY

Senior Flutter developer with 5+ years shipping production cross-platform apps end-to-end – architecture, native platform integrations (Flutter Channels, BLE), payments, and App Store delivery. As CTO, led a 4-developer team and directed system design and architecture decisions for full-stack products, including a live hardware-telemetry integration connecting physical fuel-station controllers into a production SaaS platform, with backend and web engineering executed by the team. Comfortable owning the mobile/Flutter layer completely while guiding engineers on system design, data modeling, and integration architecture. Experienced with Firebase (Firestore, Auth, FCM), payments (Stripe, In-App Purchases), and multilingual/localized products (46+ languages, Arabic RTL).

SKILLS

Technical Skills

- Flutter & Dart – Provider, Bloc, MVVM, Clean Architecture, feature-first structuring
- Native platform integration – Flutter Channels, BLE, iOS Family Controls / Time Usage APIs, Zeroconf/Bonsoir
- Firebase – Firestore, Auth, FCM, Cloud Functions (TypeScript)
- Payments – Stripe, In-App Purchases
- Localization/i18n – Flutter intl (.arb files), multi-language support (46+ languages), Arabic RTL
- Offline-first & local storage – Hive
- Version Control – Git/GitHub

Engineering Leadership & System Design

- Directing full-stack engineering teams (backend, web) – architecture review, system design, and technical decision-making
- Working literacy across Node.js/Express, MongoDB, React, and WebSocket/real-time systems – enough to direct engineers building them and evaluate their technical decisions, distinct from hands-on coding
- System design for real-time and hardware-integration requirements – data integrity (idempotency, signature verification), staging/production isolation, telemetry ingestion architecture

Soft Skills

- Team Leadership & Mentorship
- Strategic Planning & Execution
- Problem-Solving & Analytical Thinking
- Communication & Collaboration

PROFESSIONAL EXPERIENCE

Chief Technology Officer

AppSpot Software Solutions | Peshawar, Pakistan

August 2021 – July 2026

- Led a team of 4 developers, setting engineering standards (MVVM, Clean Architecture) that reduced delivery timelines and mentoring the team on modern state management (Provider, Bloc).
- Owned end-to-end Flutter development for Wgoodi, a multi-tenant fuel-station management SaaS for the Saudi market scaled to 1,000 stations, while directing the system architecture and technical decisions for its backend and web dashboard as it grew from a mobile-only tool into a full-stack production platform built by the team.
- Directed the system design for a live telemetry integration connecting Technotrade PTS-2 physical forecourt controllers to the platform via HTTP and WebSocket – defining requirements for 6 packet types (pump transactions, tank measurements, deliveries, alerts, configuration, keepalive), duplicate-transaction protection, and secure signature verification – with backend implementation led by the engineering team.
- Defined product requirements and reviewed delivery of 6 new web dashboard pages (Live Monitor, Shift Reports, Station Detail, Fuel Deliveries, Tanker Tracking, PTS station config) built by the frontend team for real-time visibility into station operations.
- Directed the decision to isolate the hardware integration on a dedicated staging environment, protecting production while the team iterated on an experimental device protocol.

- Developed My Zone, a smart-home control app using the Bonsoir (Zeroconf) package for native device discovery and control, and led Flutter-side integration of RESTful APIs, Stripe payments, and In-App Purchases across AppSpot's product line.

Flutter Developer (Freelance)

Peshawar, Pakistan

August 2020 – Present

- Built a pickup-and-delivery app with real-time location tracking and live status updates, optimized for smooth interaction throughout the delivery flow.
- Built a food-ordering app with geolocation-based restaurant discovery and a full checkout flow.
- Built a small-business e-commerce app integrated with Ecwid's store APIs, streamlining inventory management for clients.

PROJECTS

Wgoodi – Fuel Station Management SaaS

Full-stack platform for fuel retailers in Saudi Arabia, scaled to 1,000 stations, to manage multi-station inventory, vendor orders, staff/drivers, statistical reporting, and (as of mid-2026) live telemetry from Technotrade PTS-2 physical forecourt hardware. I own the Flutter mobile app end-to-end and direct the system architecture; the backend and web dashboard are built by the engineering team under my technical direction.

- Directed the re-architecture of the backend from a Firebase-only setup into a multi-tenant, multi-role platform as the product scaled from a mobile tool into a full SaaS system.
- Directed the system design for a live telemetry pipeline ingesting data from Technotrade PTS-2 forecourt controllers via HTTP and WebSocket, covering 6 packet types (pump transactions, tank measurements, deliveries, alerts, configuration, keepalive) at roughly 1-second intervals, with idempotent duplicate-transaction protection and secure signature verification to guard against a retry-heavy device protocol.
- Guided the design of the web dashboard covering stations, orders, statistics, vendors, users, and a super-admin panel, bilingual in English/Arabic with RTL layout support.
- Directed requirements for GPS-tracked truck/driver delivery management and file-upload support for order attachments and reporting.

Tech Stack: My role: Flutter (mobile app, built end-to-end) + system architecture direction. Built by the engineering team under my direction: Node.js/Express, MongoDB, React (Vite), Socket.IO, Docker, Railway, Vercel.

Vaqt (Vaktinde) – Prayer Habit Tracking App

Flutter app helping Turkish-speaking Muslims build consistent daily prayer habits through gentle, engagement-based tracking rather than guilt or pressure – deliberately avoiding shame-based UI patterns.

- Designed an offline-first data layer with Hive local caching keyed by month and rounded coordinates, cutting prayer-time API calls to roughly one fetch per user per month with instant same-month reads.
- Built an engagement-based streak system with a 6 AM grace-period evaluation (instead of midnight) and 2 automatic monthly streak freezes applied silently, so users never lose progress to one missed evening.
- Implemented a 24-badge achievement system across 5 categories (onboarding, streak, completion, total-count, and honesty/kaza-specific badges), evaluated live against Firestore stats on every user action.
- Simplified prayer-time sourcing from a two-API design (Diyanet primary + Aladhan fallback) to a single Aladhan integration using Diyanet-aligned calculation method, removing a city/district lookup table and reducing onboarding friction.
- Architected the app feature-first MVVM (data/domain/presentation per feature) with Provider + StreamProvider and go_router, and built a full Flutter localization (.arb) structure from day one to support future English/Arabic expansion.
- Enforced privacy-by-design: GPS coordinates cached locally only and never written to Firestore; location and notification permissions requested contextually rather than on first launch.

Tech Stack: Flutter, Firebase (Auth, Firestore, FCM), Hive, Provider, go_router, fl_chart, table_calendar, sensors_plus, Aladhan API

GroundView Pro – Construction Jobsite Management Platform

Native Flutter rebuild (replacing an earlier FlutterFlow prototype) of a jobsite management platform for construction companies: daily crew reports, multilingual SMS workflows, PDF sharing, and owner billing. Built end-to-end by me — mobile app, Flutter Web admin panel, and Cloud Functions.

- Built the client's Admin panel in Flutter Web, covering affiliate and referral management alongside jobsite update tracking.
- Directed the design of a per-jobsite, timezone-aware SMS scheduling system that evaluates each jobsite's own IANA timezone independently, sending report links at 8 AM local time with a capped reminder cadence.

- Built the Flutter multilingual crew submission flow supporting 46+ languages selected per crew member, integrating automatic translation to English on submission for a single consistent owner-facing report.
- Used Firebase Cloud Functions with secure storage to keep jobsite updates and user data handled server-side without exposing it directly to end users.
- Integrated Signal House SMS, Stripe billing, and Resend email touchpoints into the Flutter app across a 3-surface architecture (mobile app, Flutter Web admin, marketing site).
- Enforced Apple App Store Guideline 3.1.1 compliance by deliberately excluding all plan, subscription, and purchase-flow UI from the Flutter mobile app, keeping billing entirely on the web surface.

Tech Stack: Flutter (mobile + web admin, built end-to-end), Firebase Cloud Functions (TypeScript), Signal House, Stripe, Resend

ConnectMe – Referral & Deferred Linking App

App built around a referral growth mechanic – inviting 3 new users unlocks Premium – powered by deferred dynamic linking to correctly attribute installs.

- Implemented deferred dynamic linking on Branch.io, then migrated mid-development to Chottu Link after a client cost decision, without disrupting the referral flow already built.
- Built install-source tracking distinguishing fresh App Store installs from existing-account opens, powering an accurate 3-referral Premium unlock mechanic.

Tech Stack: Flutter (Dart), Branch.io / Chottu Link (deferred dynamic links)

4Drivers – Fleet & Courier Operations Platform

Digital platform for transport companies and express courier services, replacing paper logbooks with a fully digitized, paperless fleet operations workflow.

- Built a driver-facing photo and signature capture flow (vehicle condition checks, proof-of-delivery signatures) to digitize what was previously paper logbooks.
- Reduced operational overhead by eliminating manual data entry across fleet operations, improving visibility and control for dispatchers.

Tech Stack: Flutter (Dart)

MEPA – Location-Based Deals & Offers Marketplace

Location-based discovery app connecting users with real-time promotions, discounts, and coupon offers from local businesses and global brands, with a dual consumer/advertiser experience.

- Built a dual-mode Flutter app: a consumer-facing browse/swipe deals discovery flow and an advertiser-facing ad-posting flow (photo, offer details, country targeting).
- Implemented location-based deal targeting so users discover offers relevant to where they are or plan to travel.

Tech Stack: Flutter (Dart)

Addi Buddy – Personal Safety and Connectivity App

Personal safety app providing emergency tools and discreet communication for users in potentially dangerous situations.

- Built SOS emergency activation triggering audio/video recording and live location sharing with trusted contacts.
- Implemented tap-pattern safety check-ins, fake-call scheduling, and a discreet app-icon-swap feature for user safety and discretion.
- Integrated native device data (battery health, device details) via platform channels alongside a Firebase real-time backend.

Tech Stack: Flutter (Dart), Firebase (real-time database, auth, cloud functions)

Powermate – Screen Time Management App

Productivity app helping users manage screen time via app-level timers, group accountability, and an in-app coin economy for extensions.

- Integrated native iOS Family Controls and Time Usage APIs via Flutter Channels to enforce app-level usage restrictions.
- Built a group extension-request system and an in-app coin purchase flow for unlocking additional usage time.
- Published to both the Apple App Store and Google Play Store, with Firebase powering real-time group data sync.

Tech Stack: Flutter (Dart), Firebase, iOS Family Controls / Time Usage APIs, In-App Purchases

Frienvite – Event Discovery and Social Networking App

Platform for discovering and hosting public or private events, with integrated scheduling and group chat.

- Built public/private event hosting with invite-only access control and an integrated event calendar.

- Integrated Google Maps and Places APIs for location-based event discovery and venue details.
- Implemented in-group chat for real-time participant communication via a Firebase backend.

Tech Stack: Flutter (Dart), Firebase (auth, real-time database, cloud functions), Google Maps/Places API

CERTIFICATIONS

- “Flutter & Dart – The Complete Guide [2024 Edition]” – Udemy, instructor Maximilian Schwarzmüller (December 5, 2023)
- “Dart & Flutter – Zero to Mastery [2025] + Clean Architecture” – Udemy, instructors Maximilian Berkold and Max Steffen (January 28, 2025)

EDUCATION

The University of Engineering and Technology Peshawar (UETP)

Bachelor of Science in Computer Systems Engineering | Peshawar, Pakistan

April 2017 – August 2021

- **Inner Monk App:** Designed and developed a mobile app with audio and video functionality for course-based content delivery.
- **Final Year Project – Car Diagnostic App:** Built a diagnostic app using Flutter BLE and an ESP32 device for real-time reading of vehicle diagnostic codes.
